Module 4 Additional Readings

How Students Should Use This Resource

- Read the Core readings after the lecture. These are the minimum supporting readings and map directly to the Module 4 demos.
- Use Practical references while working in the Task Tracker repo. These are lookup references, not assigned essays.
- Use Optional deeper dives only if you want more detail.
- Use Optional extension readings only after you finish the core module work. They cover useful ideas that are adjacent to Module 4 but not taught as core content.
- When documentation and tutorials disagree with your repo, trust the repo and verify: read the diff, run the command, check the output, and refine.

Core Readings:

Recommended time: about 60-75 minutes total if students focus only on the listed sections.

Core 1. Anthropic - Claude Code overview

Link: [Anthropic - Claude Code overview](#)

Purpose: Use this to understand why Module 4 uses a terminal agent rather than only autocomplete or editor chat.

Read / use this part: Read the overview sections that explain repo-wide understanding, multi-file work, and tool use. Skip product-marketing details and anything not needed for the Task Tracker repo.

Core 2. Anthropic - How Claude remembers your project

Link: [Anthropic - How Claude remembers your project](#)

Purpose: Use this as the main supporting reading for CLAUDE.md and project memory.

Read / use this part: Focus on CLAUDE.md files, what to put in them, when to update them, and troubleshooting when Claude does not follow instructions. Skip organization-wide memory and advanced auto-memory details unless useful.

Core 3. Docker Docs - Building best practices

Link: [Docker Docs - Building best practices](#)

Purpose: Use this as the main source for why the Dockerfile should be more than merely buildable.

Read / use this part: Focus on multi-stage builds, excluding files with .dockerignore, keeping images small, and USER/non-root guidance. Skip advanced build-cloud and supply-chain sections for this module.

Core 4. GitHub Docs - Responsible use of AI code review

Link: [GitHub Docs - Responsible use of GitHub Copilot code review](#)

Purpose: Use this to reinforce that AI review should supplement human review, not replace it.

Read / use this part: Focus on limitations, missed issues, false positives, inaccurate suggestions, and the requirement to review and test before acting.

Practical References: Use These While Working

These are not required sit-and-read assignments. Keep them open while completing the hands-on Module 4 work and diagnosing problems.

Practical 1. Anthropic - Claude Code common workflows

Link: [Anthropic - Claude Code common workflows](#)

Purpose: Use this while practicing Claude Code workflows such as exploring code, planning before editing, testing, and documentation tasks.

Read / use this part: Focus on prompt recipes and plan-before-editing guidance. Skip subagents, parallel sessions, or CI automation unless you are doing an optional extension.

Practical 2. Anthropic - Claude Code best practices

Link: [Anthropic - Claude Code best practices](#)

Purpose: Use this as a lookup reference when Claude Code output starts drifting or when you need a safer workflow.

Read / use this part: Focus on environment setup, planning, reviewing diffs, and keeping context useful. Skip advanced scaling patterns until after the core module.

Practical 3. GitHub Docs - Workflow syntax for GitHub Actions

Link: [GitHub Docs - Workflow syntax for GitHub Actions](#)

Purpose: Use this when reading or editing `.github/workflows/ci.yml`.

Read / use this part: Look up on, jobs, steps, runs-on, uses, run, and matrix only as needed. Do not try to read the full reference end to end.

Practical 4. Docker Docs - Multi-stage builds

Link: [Docker Docs - Multi-stage builds](#)

Purpose: Use this when reviewing a generated Dockerfile that has a builder stage and a runtime stage.

Read / use this part: Focus on multiple FROM statements and COPY --from. Do not copy examples blindly; adapt them to the Task Tracker FastAPI app.

Practical 5. Docker Docs - Build context and .dockerignore

Link: [Docker Docs - Build context](#)

Purpose: Use this when checking whether `.env`, `.git`, `venv`, build artifacts, or unnecessary files are entering the Docker build context.

Read / use this part: Focus on `.dockerignore` matching and how the build context is sent to Docker. Use this while reviewing COPY lines.

Companion links: [Dockerfile reference - .dockerignore and USER](#)

Optional Deeper Dives: For Students Who Want More Detail

These readings are useful, but they are not necessary for the Module 4 quiz or deliverables. Use them after the core readings and practical references.

Optional 1. HumanLayer - Writing a good CLAUDE.md

Link: [HumanLayer - Writing a good CLAUDE.md](#)

Purpose: Use this for a practitioner view of what makes CLAUDE.md useful instead of bloated.

Read / use this part: Read selectively for CLAUDE.md structure and examples. Do not copy examples blindly into the Task Tracker repo.

Optional 2. Anthropic - Bringing Code Review to Claude Code

Link: [Anthropic - Bringing Code Review to Claude Code](#)

Purpose: Use this if you want to understand where Claude Code review is heading as a product feature.

Read / use this part: Read for context only. The module still teaches AI review as triage: Useful, Noise, Wrong.

Optional 3. adr.github.io - Architectural Decision Records hub

Link: [adr.github.io - Architectural Decision Records](#)

Purpose: Use this if you want more background on ADRs, decision logs, and templates.

Read / use this part: Read the overview and template links only. Do not overcomplicate the Module 4 technical note.

Optional 4. AWS - ADR best practices

Link: [AWS - Master architecture decision records](#)

Purpose: Use this if you want a more team-oriented view of ADR meetings, ownership, and decision quality.

Read / use this part: Read selectively. Skip organization/process sections that are too heavy for a small course repo.

Optional Extension: Useful Later, Not Core Module 4

These topics are useful for advanced students, but they are not part of the core Module 4 readings because they are not directly taught in the slides and recordings.

Extension 1. GitHub Docs - Security for GitHub Actions

Link: [GitHub Docs - Security for GitHub Actions](#)

Purpose: Use this if you want a roadmap of Actions security topics such as artifact attestations and OIDC.

Read / use this part: Skim the overview only. Most of this is beyond the local Task Tracker CI workflow.

Student note: This does not replace the required checks: exact Python version, no swallowed failures, intentional red run, restored green run.

Extension 2. Anthropic Engineering - Claude Code auto mode

Link: [Anthropic Engineering - Claude Code auto mode](#)

Purpose: Use this if you are curious about permissions and automation beyond the basic permission prompts shown in the module.

Read / use this part: Read for concept only. The course baseline is still conservative: inspect, approve deliberately, and verify.
